Hello Everbody,

I have a class lib which is accessing a .aspx on web through httpwebrequest and sending xml through post method. Server people provided me a .cer file. I am adding that certificate file to httpwebrequest. But their side they do not find the certificate. I tried following ways. I tried this with console app as well as ASP.NET

1) Convert the .cer file into binary

2) Imported the .cer file into Certificate store(localcomputer/current user) and exported the certificate into DER format .cer file and tried CreateFromCertFile() method.

Can anybody please point right way

Also I have few questions.

1) what preventing the certificate to reach server?

2)I added the certificate to httpwebrequest and sent to my test site and there I checked Request.ClientCertificate.IsPresent. But I always get false. Why So? Even if it is not valid certificate should present. right?
