Hi all,

I'm trying to get a client working with my ASP.NET web service. The client's been working great up to this point with a SOAP Toolkit-generated service based on a VB COM library.

On the client side, I'm calling the web service here:

```
Dim soapClient As SoapClient30
Dim xmlList As IXMLDOMNodeList
```

```
Set soapClient = GetSoapConnection
Set xmlList = soapClient.GetGroups(SYSTEM_NAME)
```

and at that last line, I get a "424 - Object required" error.

I haven't modified the code at all except to point to the new WSDL.

In the debugger I can see that "soapClient.GetGroups(SYSTEM_NAME)" contains a list of Nodes, so it's calling the service and successfully retrieving the message, but it refuses to process it.

Any guidance on this would be GREATLY appreciated.

.
