I have a solution with several projects; one is a web application, another is a web service. I have set them both up so that

Properties-->Web-->Services-->

Use IIS Web server, with Project URL: = <http://localhost/epnuc>

for the web applicaiton, and the web server is:

Project URL: =

<http://localhost/EPNUCWebService>

However, when I compile the whole solution, the Setup Builder project results in an error that says:

"two or more objects have the same target location  
('[targetdir]web.config')."

Now, why would web.config from two separate web projects land in the same web folder when I have explicitly set them to be in different web folders as noted above?

Please direct me to a better place to post this question if necessary.

Thanks!
