First off, I've placed my very first webservice on the web and can access the .asmx file through my browser. Now, as I'm writing my Client App, I want to call these services. I'm getting a strange error at Compile-Time on all of my Webservice calls. Here's some basic information. Have you seen anything like this before...and/or know how to fix it ?

Declaring an Instance of the Webservice:

```
BoardingPassService.Service bpService = new BoardingPassService.Service();
```

Line I'm calling (rideDT is a DataTable):

```
rideDT = bpService.RideSchedule_Select();
```

Error I'm getting (at compile-time)... "BoardingPass20" is my project namespace:

Cannot implicitly convert type

## Type Conversion Error at Compile-Time.

'BoardingPass20.BoardingPassService.RideSchedule\_SelectResponseRideSchedule\_SelectResult' to  
'System.Data.DataTable'

I don't understand where the  
"BoardingPass20.BoardingPassService.RideSchedule\_SelectResponseRideSchedule\_SelectResult" is coming  
from...since it's nowhere in my code.

Ideas ? !

Thanks!

-Adam-
