Hi,

I have built a windows app that makes calls to a webservice. Both webservice and windows apps are built with .net 2.0. The problem is... when I run the client Windows app on the dev machine, calls to the production webservice are very fast (milliseconds). When I run the exact same Windows app on a different machine... same log in, calling a webservice on the same production server.... EVERY call takes 5 seconds (not just the first call).

I cannot understand why this would happen, or how to debug? It happens on any client machine except the dev computer.

Any ideas?

Thanks in advance!!
James
