Hi,

when using WebRequest, in order to over come the proxy server I set:

```
Req.Proxy = new WebProxy();
```

This takes the default proxy configuration from the system (the same one you can configure in the internet explorer) and use it in the request.

Now that I'm attemping to move to WSE3 I'm looking for a place to set these same credentials when using:

```
SoapClient.SendRequestResponse(soapAction, soapRequest);
```

Is there a way to do this simply or do I have to be a WES3 guru to accomplish a simple request over a proxy server?

Gilad.
