Hello:

I have a web swervice that returns a formatted KML (Google earth) xml document.

Google Earth says it can consume it IF the top level element starts with :

<kml xmlns="<http://earth.google.com/kml/2.2>>

When I return data as string from my web servive it returns:

<?xml version="1.0" encoding="utf-8" ?>

<anyType xmlns:q1="<http://www.w3.org/2001/XMLSchema> d1p1:type="q1:string"

xmlns:d1p1="<http://www.w3.org/2001/XMLSchema-instance>

xmlns="<http://www.ga.gov/GeoKML/GeoKML.asmx>>

<kml xmlns="<http://earth.google.com/kml/2.2>>

and then Google cannot use it – so I need to learn how to remove the

<anyType xmlns:q1="<http://www.w3.org/2001/XMLSchema> d1p1:type="q1:string"

xmlns:d1p1="<http://www.w3.org/2001/XMLSchema-instance>

xmlns="<http://www.ga.gov/GeoKML/GeoKML.asmx>>

What properties and methods do you suggest. and what event

Thanks

.
