

Changing ComboBox State from within SelectedIndexChanged

I often have a situation where within the SelectedIndexChanged event of a ComboBox, I want to change the index again. For example, a changed index triggers an action that can fail, in which case I want to return the index of the combobox to its previous value. However, doing this within the event handler of course triggers another invocation of the event handler. Is there a standard idiom for handling this? I mean other than temporarily disabling the event handler, which seems pretty kludgy. Thanks.
