Hello,

I have a problem with the sample from the following article:

<http://msdn2.microsoft.com/en-us/library/system.configuration.applicationsettingsbase.aspx>

When the form is resized from the left side, or top, it will change the location to the point where it was resized to and keep the original size.

I am assuming that this is not the default behavior in this case.

Is there a workaround?

Thanks.

Regards,  
Genadij.
