I'm responding to both here instead of inline to both. First off, you will need mono installed on the linux box, and from what I hear windows forms isn't terribly good. There is a GTK# implementation, you may want to look into designing your UI using that. It probably won't look as good(GTK isn't terribly pretty, IMHO), but it will probably work across the platforms.

As for ADO.NET, I can't say much about working with oracle, but I hear the oracle provided provider is better than the microsoft one. You should probably look into that as well.
