✘ Hi.

✘

✘ We are creating an intranet here in ASP.NET and we decided that we are going to use a kind of Forms Authentication but using the users in our windows domain.

✘

✘ So, we are creating a default login form, but the user will use the name and password he uses to login to his computer.

✘

✘ I would like to know 2 things:

✘

✘ 1. How can I get a list of Windows users in my domain, so that I can list them for administration purposes.

✘

✘ 2. After getting username and password from the user, how can I check it against my domain users to see if I should grant him access?

If you're using domain validation, Forms Authentication isn't really appropriate. Forms Authentication is primarily designed for credential verification against a different source, such as a database, where you have full control over the authentication process.

I'd recommend you stick with Basic or Integrated Windows if you're authenticating against the domain.
