Hi

Have you tried to use the first approach in the kb link?  
I think the second method will use the similar steps as in the KB link to do the job.  
the code under the  
Alternative pregenerator sample  
will be compiled as a console application and it will run as below.

g. Pregenerate the serializers for the Web service by using the prepared PreGen.exe file. For example, if your proxy code is in the WindowsApplication1.exe file, run the following command at a command prompt:

```
PreGen.exe WindowsApplication1.exe
```

NOTE: This hotfix cannot be applied on a system that is running the Microsoft .NET Framework 1.1 Service Pack 1. If you installed the .NET Framework 1.1 Service Pack 1 and are experiencing the symptom that is described in this article, request the hotfix rollup package that is described in Microsoft Knowledge Base article 890673 to obtain a resolution. For more information, click the following article number to view the article in the Microsoft Knowledge Base:

Also what is the concrete problem you are encounter when you follow the steps in the KB872800 link?

If you still have any concern, please feel free to post here.

Best regards,

Peter Huang
