Technically Windows is not a realtime OS.

He should never rely that any Windows program will respond within 1 second, if he does then he has a design error.

Look at Windows explorer, opening certain sites could take a long time and it blocks execution of other programs during that time.

The GC might be a problem, especially in games, but in his case the solution would be in that he creates a device driver that does not rely on .NET, and that does respond to the request faster. Then the .NET program should connect with that device driver.

>> My q to them is why did you create .NET then?

>

It would be a selfish assumption that if you cannot create a real-time program with .NET that no one else on the whole planet should be allowed to use .NET. This .NET is a new technology that makes programming more fun, and adds more security to the application.

.
