Howdy!

> mmhh.... well maybe I was partly wrong and you it should be in the config
Partly wrong? Na, I prefer, partly right! When I was using linux for my servers @ home, it was SOOOOO frustrating to get help! I would either get the standard RTFM, "you are an idiot" or just get ignored cause I was the noob. :< And IF I did get something, it either didn't work on my dist (RH was a pretty standard one, so that baffled me :<), or the first few lines of the help were just wrong/buggy.

SO? Your help was as accurate enough that it pointed me in the right direction without any tangents to get to the answer. Thank you! :> Well, I haven't tested it out, but on the surface it looks quite accurate and makes total sense!

> truth to tell I never did it myself so it kind of just popped up out of my
> memory...

Not a problem, I do that sometimes too. But most importantly to me, you tried! :> I find that one BIG difference between MS and linux/java people, the MS people try. They try to see your problem, they try to see where you're coming from, they try to think about a few solutions, about what your rationale is for asking the question. They think about the poster/asker, they aren't IMHO so interested in showing you how smart THEY are, but helping you. Oddly enough, it's the latter that shows how smart you are!

> Just like me before, a long while ago, sigh!
Ah, so there's hope for me yet?! :>

> what means ":>" never see the smiley before...

Ah, I got used to that from my BBS days (yup, been doing this for a few years :>). If you take a gander at the keys for the smiley, it's a fast shift with left, then colon and greater. Gets to be very fast when you get into the rhythm. :>

re ;~)

I do that for the winks sometimes, or I skip the nose :<
