hi..

i have a java application server which uses RMI as a delivery transport for it's apis (it's gets the command in XML but the underlying protocol needs to be RMI)..

so i need to write an RMI CLIENT to this thing, and expose it microsoft land.

at first we thought to have it exposed as web service and consume this service via dotnet dll. the dll would be given to desktop application developers which cannot parse XML.

then i was told i could expose it as JNI and have the dll access it directly. then the dll in dot net 2.0 would either be given to desktop developers or exposed as a web service in biztalk if web services are needed.

btw can i do all of this with express edition versions?

.
