Hi All,

My application was working fine and giving me proper trace messages, but now all of sudden it started showing expcetion as

"Object reference not set to an instance of an object.

Description: An unhandled exception occurred during the execution of the current web request. Please review the stack trace for more information about the error and where it originated in the code.

Exception Details: System.NullReferenceException: Object reference not set to an instance of an object.

Source Error:

The source code that generated this unhandled exception can only be shown when compiled in debug mode. To enable this, please follow one of the below steps, then request the URL:

1. Add a "Debug=true" directive at the top of the file that generated the error. Example:

```
<% @ Page Language="C#" Debug="true" %>
```

or:

2) Add the following section to the configuration file of your application:

```
<configuration>  
<system.web>  
<compilation debug="true"/>  
</system.web>  
</configuration>
```

Note that this second technique will cause all files within a given application to be compiled in debug mode. The first technique will cause only that particular file to be compiled in debug mode.

Trace is causing exception

Important: Running applications in debug mode does incur a memory/performance overhead. You should make sure that an application has debugging disabled before deploying into production scenario.

"

What could be the cause of this problem,as I didnt change my code any ways, but when I set trace=false, it does work fine, so what is actually causing problem??is there anything wrong in my application's trace messages (some trace messages are not getting proper input) or some configuration issue with DOT NET Framework

Thanks in advance,
Manoj Singh.
