I'm having the same problem, using Vista Ultimate x64, Visual Studio 2005 TS w/ SP1 w/Vistaupdate. I'll post here if I find a solution

I also am having this issue with the exact same configuration described. Any progress toward a solution?

Update: I found a workaround to this issue:

1. Open an Administrative mode command prompt.
2. Type "mmc" then hit Enter to fire up the management console.
3. Add the ".NET 2.0 config" snap-in and enjoy.

It appears that the problem occurs only when the .NET 2.0 Configuration applet is used from Control Panel > Admin Tools. After checking what files were being accessed using Procmon, I noticed that there were indeed files that could not be found, which is evidently why the applet was throwing a System.IO.FileNotFoundException. It may be that accessing MMC from CP/Admin does not give appropriate permissions and context to successfully use the .NET 2.0 configuration applet?
