Hi,

i'm loading a third party unmanaged dll in my dot net application. the dll doesn't have a try catch block for any of the functions declarations . When a method in the dll is called by the dot net application, the dll creates a thread and for some reason the thread throws a access violation exception.

The third party vendor who provided the DLL isn't ready to fix the bug as its not happening in their C++ application.

Now in my dot net application how do i handle this issue. i tried using the AppDomain.UnhandleException event; but its not handling the AV exception and my Application always crashes with the crash info.

i don't want the application to crash and it has to run continuously.

how do i achieve this.

i would appreciate if someone can help me on this.

Thanks
Regards,
