Hi Anon,

Since using SSL means (put simply) that you are using HTTPS in place of HTTP, you can test your application by changing the protocol as you mentioned.

You can also require secure communication for a web page using IIS:

- Go to the IIS snap-in in Computer Management.
- Right-click the folder (or file) for which you want to require SSL and select Properties.
- Click the Directory Security tab.
- Click the Edit button in the Secure Communications group box.
- Select the "Require secure channel (SSL)" check box, and click OK.

Take care,

Eric
