Hi,

Check out

<http://www.yoda.arachsys.com/csharp/multithreading.html>

Near the bottom it's got some bits about Windows Forms and threading. If you're receiving callbacks then you'll run into problems displaying stuff – as a test, try getting the value of `myForm.InvokeRequired` – if that returns true inside one of your callbacks, then you do indeed have a threading issue.

Steve

different threads. I am trying to understand why the screen blanks out if I  
open some other window and come back and also as to why I am not able to  
display the message I get back from the DTS. I am new to the concept of  
multithreading and have no knowledge of how Invoke and BeginInvoke stuff  
works. Please help me here.*
