Okay I think my title line was worded misleadingly. So here goes again.

I've got quite 20 identical MDB files running on an IIS5 server.

>*From time to time I need to go into various tables and add a field or two.*

It would be great if there were an application out there that could either:

(a) sync all MDB designs (and/or data) designated to match one I've added some fields/tables to

OR

(b) go into all designated MDBs and create new field(s) or table(s).

I've began writing something like this that right now just does part of (b) but I'd rather find something that is much more slick and complete.
