well, first of all, you didn't have to delete the 1.0 framework. That was not necessary.

You've made a couple of statements that lead me to believe that you may have made one of the following, common, mistakes. Please bear with me. I am not trying to be patronizing... I am sincerely trying to help.

1) when you are running aspnet_regiis, are you in a command window, or are you attempting to run it from the windows explorer?

Make sure you are in a command window, in the

C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322 directory

```
C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322 > aspnet_regiis -i
```

If you don't give the `-i` parameter, you will see a listing of the different parameters. If you see this listing, you have not performed the command.

You should see the following two lines:

```
Start installing ASP.NET (1.1.4322.0).
```

```
Finished installing ASP.NET (1.1.4322.0).
```

2) Once you have done this step, you must restart IIS.

This can usually be done by running the IISRESET command at the command line:

```
C:\WINNT\Microsoft.NET\Framework\v1.1.4322>iisreset
```

```
Attempting stop...
```

```
Internet services successfully stopped
```

```
Attempting start...
```

```
Internet services successfully restarted
```

If you do not get these messages as a result of running `iisreset`, you have another issue.

Do you have any other software installed that may affect the iis server in general? I know you don't have Sharepoint, but do you have any ISAPI filters or security software that may be getting in the way of the

microsoft.public.dotnet.general: Re: Error.Error..Error...web server is not running asp.net 1.1

installation or the detection of the installation by Visual Studio?
