I would not recommend doing this. The app.config file was not really designed to be modified in code after the program is installed and running. It can be done but it is very difficult. The only way I know how to do it is to load the config file into an XML document, make the changes and save it back over the config file. I have seen examples of this on Google groups. Try searching for vb.net change application.config file in code. I would recommend using a simple ini file.
