Hi all,

I get two problems, I don't know if there are related, but I do know that I'm already stuck for days on them.

First problem :

Visual Basic .NET compiler is unable to recover from the following error:
System Error &Hc0000005& (Visual Basic internal compiler error) Save your work and restart Visual Studio .NET.

I found on the net that you get this error when the compiler crashes and that you have to check your source code to solve the problem.

But I get this problem only when I start visual studio 2003. When I restart vs the problem doesn't occur anymore.

Second problem :

I create a new asp project, with just one button on the startup form but when I run I always get a messagebox with the error : "Error while trying to run project." And that's it, no further information. I'm using visual studio 2003, xp prof with service pack 2.

Also old asp projects I created doesn't run anymore, I get the same error.

The problem doesn't only occur when debugging, it occurs always.

I found on the internet a lot the problem : "Error while trying to run project: Unable to start debugging on the Web server." But nothing in there solves my problem.

I also did not install the .net framework 2.0 Beta.

When I start IE and the url of the project, I see my webpage fine.

I'm almost at the point to do a complete reinstall so PLEASE HELP

Kris.
