

.NET and keeping my source code to myself...

I'm sure this has been discussed here plenty of times before (feel free to point me to the thread!) but I want to learn as much as possible about the single most talked about issue with .NET development. Disassembly into source code and preventing that from happening!

Thinstall (thinstall.com) – I own it from previous projects (non – .NET) but don't have faith that it can single handedly protect my source code.

What can I do to help, and what level of *real* protection can I get with the obfuscators and other protection tools that are out there? Is there any single solution to this problem?

Thanks!
