I deleted Cookies and Files under Internet Options...

Also following Settings... under Internet Options... I Viewed Files... and deleted all files shown.

Under Viewed Objects... there are about 20 files under C:\WINDOWS\Downloaded Program Files. I'm not sure if I should delete all these.

Then "Cleared History."

On returning to the problem web page, there was still an error but the message box differed from the one seen originally. This one now says:

Problems with this Web page might prevent it from being displayed properly of functioning properly. In the future you can display this message by double clicking the warning icon displayed in the status bar.

Under this are the details:

Line: 15  
Char: 1  
Error: Syntax error  
Code: 0  
URL: <http://www.bridgeplace.com>

This message box has Previous and Next buttons that can cycle through errors. When the mouse over error occurs, the line is 83 and the error is "Object Expected."
