Phil,

Many thanks for the swift reply.

When I use the GACUTIL, then find the entry in the GAC, right click and look at properties, there is an entry for Codebase, which references the location of the dll I installed using the GACUTIL.

If I check the GAC after I use the installer there is no entry for the codebase on the dll's properties.

Do I need to do anything special because it is an interop dll?

Regards
Tim
