I have found one .Net control that I just love.....DotNetBar. But, I haven't found a plethora of great controls or class libraries (like I had with my VB 6).

What am I missing? (No spam please. I'm looking for controls that you use in your own projects that you like.)

Please include links to the sites if you have them. (DotNetBar is at <http://www.devcomponents.com/dotnetbar/> )

I miss having a large library of cool controls that make RAD programming as easy as it used to be in VB 6.

IMHO, Microsoft really screwed up with VB.Net in the first 2 iterations. They abandoned millions of part-time programmers and destroyed a lucrative software market that targeted part-time-programmers and Microsoft products. But, why not? I mean, Visual Basic 6 programmers were only the largest group of programmers in the world. Who needs THAT?

I am glad to see that, in Visual Basic 2005, Microsoft is trying to get back what they screwed up. And, they are making a good first stab at it.

Unfortunately, I don't think they'll ever regain the status they once held with the VB market. People just don't forget it when you toss them aside like so much trash. Go figure.....

Anyway.....still trying to regain the RAD experience with MS products. So, send links if you got 'em.

Thanks!
