Thank you Vadym,

The problem I have is with 2 applications

The first one the exact error I get is an exception ;  
An exception 'System.IO.FileNotFoundException' has occurred in todo.exe  
So with that one i assume a file is not being found somewhere that is trying  
to be opened so I can find that with a bit of searching.

The second application runs but acts weirdly on the first run, then on the  
second run works fine. Thats the one im really stumped on. I will try out  
with the Debugger.Launch() and see how I go with that.

Thank you heaps for your time Vadym, very much appreciated here.

Hello, John!

Give more description on what's happening? Application isn't starting?  
Are there any exceptions being thrown? Do you see any info in the  
EventLog?

You can debug your app after install. To do this you can include debug  
assemblies into your  
setup project.

In the entry point ( e.g. Main() ) insert

```
#if DEBUG  
Debugger.Launch();  
#endif
```

## Re: Deployment and DLL's

call.

This call will result in VS debug dialog appear, attach with Visual Studio and see what will happen next...

JS> Hi there I have a windows dotnet application that I am attempting to  
JS> create  
JS> a deployment setup file for.

JS> The application runs fine when run from visual studio, but as soon  
JS> as I  
JS> install it from the setup things go awry. Does anyone have any idea  
JS> on how  
JS> to debug this? I suspect it may be something to do with DLL's not  
JS> working  
JS> properly but I really got no idea.
