Ahhhhhhhhh the joyous white window of pain – before you attempt to rash behavior like closing the solution and reopening it; try closing the form, then CLEAN the solution the rebuild... Once it's done try and open your form again – Failing that the Beta SP1 is out that rectifies this glitch – I'm assuming it's a VB project in 2005?

Alain,

You have probably changed some things in the designer part. That you have to undo.

Hi,

I've created a Form just for testing purposes.
on this form i have a custom control that i created.

Every time that i update my custom control (dll file), my test form displays the following message :

"One or more errors encountered while loading the designer. The errors are listed below. Some errors can be fixed by rebuilding your project, while others may require code changes.

The variable 'aR_ListView1' is either undeclared or was never assigned.
Hide

at
System.ComponentModel.Design.Serialization.CodeDomSerializerBase.Error(IDesignerSerializationManager, String exceptionText, String helpLink)

Re: form design question

```
at
System.ComponentModel.Design.Serialization.CodeDomSerializerBase.DeserializeExpression(IDesigner
manager, String name, CodeExpression expression)
at
System.ComponentModel.Design.Serialization.CodeDomSerializerBase.DeserializeExpression(IDesigner
manager, String name, CodeExpression expression)
at
System.ComponentModel.Design.Serialization.CodeDomSerializerBase.DeserializeStatement(IDesigner
manager, CodeStatement statement) "
```

I need to close the Form1.h [Design] window and to open it again to have my form displayed normally...

how can i do to make MS VC++ refreshing itself without closing–opening the form designer to see it ?

Thanks,

Alain
