Is there an Asp.Net equilvant of VB6's Me.Name? And hopefully it will contain the path of the page.

What I want to do is use the name as the return page from a called page. I'd like to write something like:

```
'Calling page:  
Save me.name in Cookie  
Call SomePage  
-----  
'Called SomePage  
Do Stuff  
Get me.name from Cookie  
Return to me.name
```

Or is there a better way to do this?

Thanks,
Larry

Have a look at the following properties o the request object and see if they can do what you are looking for

- Path
- RawURL
- URL

Bits.Bytes
