Hi,

I have an application, the user are able to change records in this application.

Also, there's a button called "What If".

After the user pressed the "What If" button, the user may change the records and save it. When the user open the same record again, all the changes is there. (Pls. notice that the user is still in the "What If" environment). Somehow the changes are save to a mirror table record.

The changes would only affect the real records until the user press another button called "Accept changes", in which all the changes in the mirrored table would be adapted into the real record.

Is there any way i can do it via C# and MS Sql Database?

Pls. advice and thanks in advance
