I am trying to fill a datalist with table names from an Oracle database. The program works fine using the following code:

```
private void GetTables()
{
    // open a database connection
    string con = connectLabel.Text;
    cn = new System.Data.OleDb.OleDbConnection(con);
    cn.Open();

    //Declare a DataTable Object
    System.Data.DataTable dt ;

    //Query for getting the list of all tables from the schema , no restriction
    dt = cn.GetOleDbSchemaTable(OleDbSchemaGuid.Tables, null);

    //Display the tables in the tablesList
    tablesList.DataSource = dt;
    tablesList.DataBind();
}
```

However, the datalist displays System.data.DataRowView in the datalist when I run the program. What do I need to change in the above code to fix this
