Oh really? That stinks. I'm not expecting high traffic but I didn't realize you had to have a page submit for a function as easy as this to work. Ugh, I was hoping I wouldn't need to have any client side scripting. I didn't really want to use javascript/vbscript. I like handling everything in c#...at least ever since i've converted. And I guess it was assuming too much that an event handler would be able to change stuff on a webform w/o the need to submit. But...I guess that does make sense.

Thanks Trebek. And if anyone has any other ideas besides client-side scripting, I'm all ears.
