Thanks, but I have already tried this: `Process [] aProcesses = Process.
GetProcesses();`

The same thing, this works fine on the 'original' machine (XP), but when copied to another one (win2k), I get access denied, trying to get processes from 'remote machine'.

I have switched impersonation on and gave full rights to aspnet user, but still no success... :(

Regards,

/Denis

Your parameter is incorrect. If you need processes running on the local machine, you need to simply do a `getprocess()` and store the results in an array. This is most likely the cause of the permissions error you are experiencing since you do not have access to the remote process.
