You can't bypass the logon, as the check happens at the application level via the .net framework, so the redirect happens before the page is properly accessed. You could either add the code into the page\_load of the login page to check the referrer, and popup the page accordingly, or else use a htm as the popup(as the extension exists outside the .net framework).

Another option is to use a subfolder with it's own configuration. web.config's work in a hierarchial tree based way, so you could have your popup page in another directory, that contains it's own web.config, that allows unauthenticated access to it i.e.

javascript:window.open('unauth/wfpopup.aspx....
