Do you mean objects overall, or only controls like these in Windows Forms?  
As you know, object is an instance of class. So you need to understand how  
to  
define classes (not objects) etc..  
Read about constructors, methods, fields, operators, properties -> object  
oriented programming.  
There is a lot stuff in Internet, try google.

But if you mean objects as controls like WinForms, try examples in CodeGuru,  
<http://www.codeproject.com/>  
or google.
