Sure enough a search in the aspnet groups found something that might help you:

http://groups.google.ca/group/microsoft.public.dotnet.framework.aspnet/browse_thread/thread/8c1c8fbe9e5fe956/d227

The VS 2005 conversion tool did not properly convert my explicit @Reference directive tags on the .ascx page, probably because no static control of that type actually appears as a static control on the page. It has been suggested that reference tags should be included on the static page when using LoadControl() to load controls dynamically in the code behind. To ensure that the tag is correct I actually drag the user control on the design view of the page and then delete it.

.
