Hi Ron, some options.

Use NT authentication instead.

Or tell your web server not to serve EXE files.

Put items you don't want served in another folder. This can be a subfolder in your app, just ensure that your web account doesn't have access to that folder.

Also (someone remind me) can you configure individual page loading options in the Global.asax? I know you can config for application and session start and ends, what about pages as well?

.
