Hi over there,

We are a team of 6 developping web applications (ASP.Net/C#/VB.Net/SQLServer). What happens is that randomly, each of us get the below error in (PS). We believe that the "access is denied" error description [probably] is a "dummy message" b/c the file name changes the very next time we compile for no reasons. (we think that it didn't have any reason in the first place b/c no changes of any kind were done to it or to the files/modules which are accessing it)

Sometime after adding all the permission possible to that file (dll), that may make it to work with a chance of 10%, sometime we can restart www service and it may work with very low chances, sometime a rebuild of the solution may make it to work (low probability too) and sometime we delete references (of our build in house dlls) then add them back may make it to work (low chances to work).....

but sometime we can spend hours to figure out and only a reboot will make it to work.

For certain, the only thing that makes it to work for sure is a reboot.

The error shows up very frequently (every 30 mins). This is very time consuming for each of us we really can't link it to anything in our project as a cause of the problem.

Anyhelp or idea is very much appreciated,  
Thank you in advance,
