Ignacio Machin (.NET/ C# MVP) wrote:

Why each user needs a different connectionstring?
Even if they have different privileges you can use the very same connectionstring, it's a business rule who access what, and should therefore be enforced in your dll.

Good security calls for security all the way up the chain, even at the database layer.

Imagine someone got ahold of that connection string; they could now have free reign to execute any sql they wanted. Security, to be effective, must be present in every layer.
