I have trace configuration data in my config file and I want to specify outoption flags like this:

```
<code>  
traceOutputOptions="Callstack | DateTime" />
```

```
</code>
```

This throws an exception because it can't be parsed. I have never seen how to combine flags in a config file. Is it possible?

I haven't tried, but test it with a comma-delimited list instead (this is how ToString method displays on a flag when you pass in the parameter to display names on a flag enumeration).

HTH,
Mythran
