I figured out that the section that says

```
{
if (Click != null)
{
CreateChildControls();
Click(this, e);
}
}
```

was causing a problem. I removed the CreateChildControls and now my username field holds it's state. However, I still can't get the checkbox to hold it's state. If I change the password field from password mode to normal text mode, it does hold it's state. Is there a trick to getting a checkbox to hold it's state? Thanks.
