Hi Peter,

Could you place more PictureBoxes on one row in the panel in order to minimize the total height of all the PictureBoxes? If no, in my opinion, using ListView is a good solution for your problem.

.....,only when the paint event occurs for the first time is when the

graph is created and image of this graph is taken and placed in the picture box,

Would you tell me how you create the graph and place the image of this graph in the picture box?

I don't know how would I create Image list on the fly when the paint event occurs in the ListView.

I think you could create an image list and initialize it in the form's Load event handler.

Plus ImageList is limited to 256 pixels for width or height of a picture

and the width will be dependant on the current width of the control.

Yes, it is. But 256 pixels for height and width should be enough for the images in your program. If the ListView's width is less than that of a ListViewItem , the vertical scrollbar will appears. If you don't like it to

Re: Panel Height

appear, you could enlarge the width of the ListView.

I look forward to your reply.

Sincerely,

Could you place more PictureBoxes on one row in the panel in order to minimize the total height of all the PictureBoxes? If no, in my opinion, using ListView is a good solution for your problem.

I can not place more than one picture per row, it would be confusing to a user. The image size is too restricting for my purpose.

Would you tell me how you create the graph and place the image of this graph in the picture box?

I am using ZedGraph control to create Graphs and images of those graphs
http://zedgraph.org/wiki/index.php?title=Main_Page

I think you could create an image list and initialize it in the form's Load event handler.

The graphs / images are created after the form loads, after user clicks on the create graphs button

Yes, it is. But 256 pixels for height and width should be enough for the images in your program. If the ListView's width is less than that of a ListViewItem, the vertical scrollbar will appear. If you don't like it to appear, you could enlarge the width of the ListView.

256 pixels is not enough for width

I think I have found a solution for this, Vertical Scroll bar control, scrolling is not as smooth as Panel scroll bar but it will work and it's

Re: Panel Height

Re: Panel Height

unlimited. With Vertical Scroll bar I can place only visible images on a Panel and replace them as the user clicks on the scroll bar control.
