Brett,

Have you worked with the Server Explorer? You can establish a connection to your database, and then drag the stored procedure from the explorer (under the Data Connections) to a DataSet designer and it should create wrappers for making calls to the stored procedure.

Hope this helps.

Anyone know of a good way to autogenerate stored procedure parameters to put into c# code? I don't need to do it on the fly, just while coding. I've got some SPs with a lot of parameters, so it would save some time to be able to make the code for the SqlParameter object automatically.
