Hello,

I am having some issues printing to a dot matrix printer.

The printer in question is a Lexmark form printer, loaded with fan fold paper using the tractor feed. The paper itself is a custom size.

I've added a custom size form and set this to be the default form size for the printer, I've also set the tractor feed to be default (rather than manual page feed).

When running the C# code, all seems good – the print document page size is all set correctly and the output is all where I expect it on the printed page.....BUT then when the page is finished it does what looks like a form feed so pushes multiple pages up the tractor feed. Doh!

Anyone got any ideas how to get around this? Can this feed be suppressed?

Many thanks

Mat
