I think this question could be answered in one word, either "No" or "Name-of-the-control".

Am (still unfortunately :-)) having to use .NET 1.1 at work. Would like to display a simple text file within a control from which I could derive and overload the normal Paint method. However, I would like the control to support basic FIND functionality within the text.

Essentially I need a control which offers a cut down version of the functionality offered by "Notepad".

Question : Is there such a control ?. If so, what. If not any other ideas.

I can imlement my own basic find functionality etc by overloading methods when deriving from say a Text Box control, but do not want to begin to reinvent an already perfectly formed wheel, if such a wheel exists.

Thanks guys and gals for your time.

Paul.
