Thanks Adam and Kevin,

I was basing my work off of FTPClient and another library. I got everything to work. After I receive the file I change the modified date time to match that of the ftp site. I also found some code that lets me parse the FTP directory listing, not pretty. :)

I will probably have to go to a pay-for component when the requirements expand.

~Gina~

I used an early version of Xceed's FTP component with good results. And I must agree with your earlier comment – don't bother writing your own. It's cheaper to buy.

HTH,

Adam.
