You mean like this?

This snippet should be placed in your new form. It will set the left and top position of this new form 50 pixels below and to the right of the parent form.

```
this.Left = this.Owner.Left + 50;  
this.Top = this.Owner.Top + 50;
```

Hope you can use it.

I am creating a System.Windows.Forms.Form derived form in an OnClick() method of a button. I would like to set the position of this new form on the window, but I can't figure out what method to call or property to set to override where the Operating System places the window. Any brilliant ideas out there?

Thanks
