I've had nothing but trouble from the System.Net.Mail objects, but I finally need to make them work, and I can't for the life of me see what I'm doing wrong.

I pared back my mail transaction to the bare minimum:

```
System.Net.Mail.SmtpClient smtp = new System.Net.Mail.SmtpClient("<my  
mail server IP>", 25);  
smtp.Send("<one of my email addresses>", "<another of my email  
addresses>", "Hello", "World");
```

And on the smtp.Send() command I get back a SmtpException {"Failure sending mail."}, {"An invalid character was found in the mail header."}.

An inspection of the MailMessage object (before I simplified that away) showed that there were no items in the header before this exception. A packet trace during the exception shows that the SMTP server responds properly and the object immediately replies with a "QUIT".

I would greatly appreciate any insight that could be offered.
Thanks,
Andy
